APAAR Admission Registry

A beginner-friendly guide to what the project does, who uses it, and what is ready today.

In one sentence
It helps colleges send student admission details, checks those details against allowed seats, and gives AICTE a clearer record of what happened.

1. What problem are we solving?

AICTE receives information from approved colleges in different ways. Some reports contain details about each student; others mainly contain totals. That makes it hard to spot repeated records, check whether a college admitted more students than allowed, or answer later questions about one admission.

This project gives colleges one consistent way to send records after admissions. It connects each record to the student's APAAR academic identity, checks the admission against the college's allowed seats, and keeps a history of the result.

2. A few words made simple

Word	In everyday words
APAAR ID	A student's national academic identity number. This project does not contact the official APAAR service yet.
Approved intake	The number of seats a college is allowed to fill for a course and year.
Actual enrolment	The number of students the college really admits and reports.
Supernumerary seat	A special seat outside the ordinary count, when the applicable rule allows it.
NRI	A category for Non-Resident Indian admissions. Here, those seats still count inside the ordinary allowed intake.
OCI	Overseas Citizen of India. Specific rules may allow a special seat category.
FN	Foreign National. A separate limit can apply when the approval permits it.
TFW	Tuition Fee Waiver. It is counted separately and cannot be changed into another seat type.
Manual review	The system asks an authorised person when it cannot safely decide by itself.
Made-up example	A fictional record created for safe practice. Every example here uses SYNTH- identifiers.

3. How the journey works

Think of it as a careful intake desk: the college sends a list, the platform checks each line, and the right people can inspect the result.

1 · College Sends admission details	→	**2 · Checks** Finds missing or repeated details	→	**3 · Seat rules** Checks the allowed limits
6 · AICTE view Shows records and summaries	←	**5 · Receipt** Keeps the result and history	←	**4 · Result** Accepts, rejects or asks a person

If a line does not pass, the college sees why and can correct it. If an official decision is needed, the platform asks a person instead of guessing.

4. Who uses it?

College operator

Sends the student file, checks row results and fixes the lines that need attention.

AICTE reviewer

Monitors admissions, examines unusual cases and recommends what should happen.

AICTE checker

Independently checks some actions before they are carried out.

Auditor

Looks at the history and checks who did what.

Authorised verifier

Checks limited information for an approved reason.

Student

Benefits from a record that can be checked and explained. The current local version does not offer a live official APAAR check.

5. What can a judge try?

• Choose AICTE reviewer, open Policy Lab and select “Winning scenario.” Change the allowed intake to see how outcomes change.

• Choose Institution operator, open Batch upload and try the included fictional student file.

• Open Casework as reviewer, then as checker, to see why these are separate steps.

• Open Integration assurance and inspect example success, failure and receipt states.

The **Judge Guide** gives the complete click-by-click path and local start instructions.

6. Why this helps

Checks seats before a decision is final. Different seat types are counted separately. The last allowed seat cannot be accepted twice just because two requests arrive together.

Explains each result. A person can read the reason, and the same reason has a consistent code for records and reports.

Makes large uploads manageable. A college submits one standard file, sees each row's result and corrects only the rows needing attention.

Separates review and checking. One person can review a sensitive case; another person independently checks the action.

Lets AICTE test a change safely. Policy Lab replays a fictional group of 84 students using a proposed seat policy. It shows the difference without changing admission records.

> **The shown "Winning scenario" is only an example.**
> It shows 9 more admissions that fit the proposed rules, 5 excess cases kept blocked, and 2 cases sent to a person. These are fictional example numbers, not national statistics.

7. What is ready today—and what needs permission

The local platform has a working browser portal, seat checks, file upload and correction, case review, recorded history, role boundaries and a local database. The team has also run automated checks and a complete fictional journey on its own computer.

The official APAAR identity check, AICTE sign-in and approval feed, government signing, real student details, production hosting and a supervised college trial are not connected. Those need permission, access details and safety review from the responsible organisations.

> **Important**
> This is not an official AICTE or APAAR service. All records shown to judges are fictional and begin with SYNTH-. No real student details are used. A local example proves the software journey, not an official national rollout.

8. Why put APAAR ID next to the college ID on a certificate?

The college ID identifies a student within that college. APAAR is meant to help connect study records across education. Showing both, when rules and consent allow, helps a later checker match a certificate to the right learning record. This remains a planned use here, not a live official feature.

Remember these four things

The college sends a record. The platform checks the student and the seat. Unclear cases go to a person. AICTE gets a clearer view of what happened.
